

## ABSTRACT OF THE DISCLOSURE

An image forming system is provided which significantly improves the operability in setting functions relating to image formation in an individual destination device selecting mode or an automatic destination device selecting mode. The image forming system includes a plurality of image forming devices with a plurality of functions relating to the image formation, and is able to select an image forming device, to which an image inputted from one of the image forming devices is to be outputted, from the image forming devices. The image forming devices designate either one of the automatic destination device selecting mode and the individual destination device selecting mode from inputting operation through an operating part, and acquires function information representing a plurality of functions relating to the image formation from the image forming devices by means of a CPU. The CPU controls the display of information about the functions relating to the image formation on an information input screen displayed on an LCD of the operating part according to the designated destination device selecting mode and the acquired function information.
